12:30pm - 1:20pm
Thursday, February 14
Health Sciences Building
Room D-209

The new Bullitt Center in Seattle has endeavored to meet the ambitious goals of the Living Building Challenge, the world's most strenuous performance standards for sustainability. The Center will generate its own electricity, treat its own wastewater on site, and incorporate many other cutting edge and environmentally sound design and construction features. Great efforts were made to omit "Red List" materials from the

core and shell of the building, such as PVC, mercury and endocrine-disrupting chemicals. Join us for a project overview and discussion to learn about the construction material selection process, manufacturer transparency, and lessons learned from the development of the Bullitt Center project.

This seminar is free and open to the public!
